## Compact LCD Bias IC With High Speed Amplifiers for TV and Monitor TFT-LCD Panels

## FEATURES

- 2.5 V to 6.0 V Input Voltage Range
- Vs Output Voltage up to 18 V
- 1\%-Accurate Boost Converter With 4.5 A Switch Current
- 600 kHz Fixed Frequency PWM Operation
- Overvoltage Protection
- Adjustable Softstart
- Regulated Positive Charge Pump Converter VGH
- Integrated Gate Voltage Shaping of VGH
- Regulated Negative Charge-Pump Driver VGL
- Adjustable Sequencing for Vs and VGH
- 3 Integrated High-Speed Operational

## Amplifiers

- 50 MHz 3 db Bandwidth
- Slew Rate 45 V/ $\mu \mathrm{s}$
- 215 mA Short Circuit Current
- High Voltage Test Mode (HVS)
- Thermal Shutdown
- 40-Pin $5 \times 5-\mathrm{mm}$ QFN Package

## APPLICATIONS

- LCD Monitor
- LCD TV Panel

## DESCRIPTION

The TPS65165 is a Compact LCD Bias IC with 3 high-speed operational amplifiers for gamma correction and/or VCOM supply. The device generates all 3 voltage rails for TFT-LCD displays (Vs, VGL and VGH). The device incorporates a high-voltage switch that can be controlled by a logic signal from the timing controller (TCON) to provide the gate-voltage modulation for VGH. If this function is not required, the CTRL pin can be tied high.

## TPS65165

SLVS723A-DECEMBER 2006-REVISED MAY 2007
The device also features a high-voltage stress test, where the output voltage of VGH is typically set to 30 V , and the output voltage of Vs is programmable to any higher voltage. The high-voltage stress test is enabled by pulling the HVS pin high. Adjustable sequencing is implemented, and can be programmed by selecting the capacitor values connected to ADLY and GDLY. The device consists of a boost converter to provide the source voltage Vs operating at a fixed switching frequency of 600 kHz . A fully integrated positive charge pump, switching automatically between doubler and tripler mode provides an adjustable regulated TFT gate on voltage VGH. A negative charge pump driver provides adjustable regulated output voltage VGL. To minimize external components the charge pumps for VGH and VGL operate at a fixed switching frequency of 1.2 MHz . The device includes safety features like overvoltage protection of the boost converter, short circuit protection of VGH and VGL as well as thermal shutdown.

## ORDERING INFORMATION ${ }^{(1)}$

| $\mathbf{T}_{\mathbf{A}}$ | ORDERING | QFN PACKAGE | PACKAGE MARKING |
| :---: | :---: | :---: | :---: |
| $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | TPS65165RSBR | RSB | TPS65165 |

(1) The TPS65165RSBR is available taped and reeled and shipped in quantities of 3000 devices per reel.

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

## DISSIPATION RATINGS ${ }^{(1)}$

| PACKAGE | $\mathbf{R}_{\theta J A}$ | $\mathbf{T}_{\mathbf{A}}<\mathbf{2 5}{ }^{\circ} \mathbf{C}$ <br> POWER RATING | $\mathbf{T}_{\mathrm{A}}=\mathbf{7 0} 0^{\circ} \mathbf{C}$ <br> POWER RATING | $\mathbf{T}_{\mathrm{A}}=\mathbf{8 5}{ }^{\circ} \mathbf{C}$ <br> POWER RATING |

PIN ASSIGNMENT

NOTE: The exposed thermal die is connected to AGNG. NC pin is internally not connected.
TERMINAL FUNCTIONS

| TERMINAL |  | I/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| C2N | 1 | I/O | Negative terminal of the flying capacitor for the positive charge pump. Typically a 330nF flying capacitor is required. |
| C2P | 2 | I/O | Positive terminal of the flying capacitor for the positive charge pump. Typically a 330 nF flying capacitor is required. |
| BGND | 3 |  | Low noise ground for the operational amplifier. |
| SUP | 4 | I | Supply input for the operational amplifier and charge pump stages. Connect to the main output Vs, with a $1-\mu \mathrm{F}$ bypass capacitor. |
| POS1 | 5 | I | Non-inverting input of Operational Amplifier 1. |
| NEG1 | 6 | 1 | Inverting input of the Operational Amplifier 1. |
| OUT1 | 7 | 0 | Output of Operational Amplifier 1. When the device is disabled, the output is pulled to GND via a $1-\mathrm{k} \Omega$ resistor. |
| OUT2 | 8 | O | Output of Operational Amplifier 2. When the device is disabled, the output is pulled to GND via a $1-\mathrm{k} \Omega$ resistor. |
| NEG2 | 9 | 1 | Inverting input of Operational Amplifier 2. |
| POS2 | 10 | I | Non-inverting input of Operational Amplifier 2. |
| POS3 | 11 | 1 | Non-inverting input of Operational Amplifier 3. |
| OUT3 | 12 | O | Output of Operational Amplifier 3. When the device is disabled, the output is pulled to GND via a $1-\mathrm{k} \Omega$ resistor. |
| NC | $\begin{aligned} & 13,19 \\ & 26,31 \end{aligned}$ |  | Not connected. These pin can be connected to GND to improve the thermal resistance of the package. |
| ADLY | 14 | O | Adjustable EN high-to-start-up delay of the main boost converter, negative and positive charge pump. Connect a capacitor from this pin to GND to set the desired delay time. (See SETTING THE DELAY TIMES ADLY, GDLY) |
| GDLY | 15 | O | Adjustable EN high-to-enable delay of the high-voltage switch Q8 (gate voltage shaping). Connect a capacitor from this pin to GND to set the desired delay time. (See SETTING THE DELAY TIMES ADLY, GDLY) |
| CTRL | 16 | I | Logic control input for the internal high voltage switch (gate voltage shaping). |

## PIN ASSIGNMENT (continued)

## TERMINAL FUNCTIONS (continued)

| TERMINAL |  | I/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| HVS | 17 | 1 | Logic control input to enable High Voltage Stress Test. With HVS=low the high voltage stress test is disabled. With HVS=high the high voltage stress test is enabled. |
| DRVN | 18 | I/O | Drive pin for the negative charge pump converter generating VGL. Using a single stage charge pump inverts the voltage present at the main boost converter Vs and regulates it down to the desired voltage programmed by the feedback divider. |
| SS | 20 | 0 | Softstart for the main boost converter generating Vs. Connect a capacitor to this pin to set the softstart time. |
| FBN | 21 | 1 | Feedback of the negative charge pump converter. |
| REF | 22 | 0 | Reference output. Connect a $220-\mathrm{nF}$ capacitor directly from REF pin to AGND to minimize possible noise coupling into the reference of the IC. |
| AGND | 23 | 1 | Analog Ground, positive and negative charge pump ground. |
| VIN | 24 | 1 | Supply pin for the IC. Bypass this pin with a $1-\mu \mathrm{F}$ capacitor directly to GND. |
| EN | 25 | 1 | Enable pin of the IC. EN=high enables the IC. EN= low disables the IC. This pin must be terminated. |
| PGND | 27, 28 |  | Power Ground for the boost converter. |
| SW | 29, 30 | I/O | Switch pin of the boost regulator generating Vs |
| RHVS | 32 | 1 | This resistor sets the voltage of the boost converter Vs when the High Voltage Stress test is enabled. (HVS=high). With HVS=high the RHVS pin is pulled to GND which sets the output voltage for the boost converter. When HVS is disabled (HVS=low) the RHVS pin is high impedance. |
| COMP | 33 | 0 | Compensation for the regulation loop of the boost converter generating Vs. |
| FB | 34 | 1 | Feedback of the boost converter generating Vs. |
| VGH | 35 | 0 | This is the output voltage of the internal high voltage switch, controlled by the CTRL signal. |
| DRN | 36 | 1/O | Connect the discharge resistor for the Gate voltage shaping to this pin. |
| FBP | 37 | 1 | This is the feedback for the positive charge pump converter generating VGH |
| POUT | 38 | 0 | Output of the positive charge pump which is internally connected to the high voltage switch Q2. Connect a $1-\mu \mathrm{F}$ output capacitor to this pin as well as the feedback divider to set the output voltage for the positive charge pump respectively for VGH. |
| C1P | 39 | I/O | Positive terminal of the flying capacitor for the positive charge pump. Typically a $330-\mathrm{nF}$ flying capacitor is required. |
| C1N | 40 | I/O | Negative terminal of the flying capacitor for the positive charge pump. Typically a $330-\mathrm{nF}$ flying capacitor is required. |

APPLICATION INFORMATION

Figure 14. Control Block TPS65165

## THERMAL SHUTDOWN

The thermal-shutdown feature prevents damage from excessive heat and power dissipation. Typically the thermal-shutdown threshold is $155^{\circ} \mathrm{C}$. When the device enters thermal-shutdown then the device does not restart automatically. The device can only be restarted by cycling the input voltage below its undervoltage-lockout threshold or by cycling the enable EN to ground.

## APPLICATION INFORMATION (continued)

## UNDERVOLTAGE LOCKOUT

To avoid device malfunction at low input voltages, an undervoltage lockout is included which enables the device only when the input voltage exceeds 2.3 V .

## REFERENCE OUTPUT, REF

The device provides a reference output that is used to regulate the negative charge pump. In order to have a stable reference voltage, a $220-\mathrm{nF}$ bypass capacitor is required, connected directly from REF to AGND. The reference output has a current capability of $30 \mu \mathrm{~A}$ which should not be exceeded. Because of this, the feedback resistor value from FBN to REF should not be smaller than $40 \mathrm{k} \Omega$.

## START-UP SEQUENCING

Start-up sequencing can be controlled by adjusting the delay times ADLY and GDLY. After the delay time set by ADLY passed by, the boost converter, negative and positive charge pumps start at the same time. VGH will only go high once the delay time, set by GDLY passed by and the signal applied to CTRL is high.

Figure 15. Power-On Sequencing

## SETTING THE DELAY TIMES ADLY, GDLY

Connecting an external capacitor to the ADLY and GDLY pin sets the delay time. If no delay time is required these pins can be left open. To set the delay time, the external capacitor connected to ADLY and GDLY is charged with a constant current source (typically $5 \mu \mathrm{~A}$ ). The delay time is terminated when the capacitor voltage has reached the internal reference voltage of $\mathrm{Vref}=1.213 \mathrm{~V}$. The external delay capacitor is calculated by:

$$
\begin{equation*}
C_{\mathrm{dly}}=\frac{5 \mu \mathrm{~A} \times \mathrm{td}}{\text { Vref }}=\frac{5 \mu \mathrm{~A} \times \mathrm{td}}{1.213 \mathrm{~V}} \tag{1}
\end{equation*}
$$

with $\mathrm{td}=$ Desired delay time

www.ti.com

## APPLICATION INFORMATION (continued)

## BOOST CONVERTER

The TPS65165 boost converter block is shown in Figure 16. The boost converter operates with PWM (Pulse Width Modulation) and a fixed switching frequency of 600 kHz . The converter uses a unique fast-response, voltage-mode controller scheme with input voltage feedforward. This achieves excellent line and load regulation ( $0.2 \% / \mathrm{A}$ load regulation typical) and allows the use of small external components. To increase the flexibility in the selection of external component values, the device uses external loop compensation. Although the boost converter looks like a non-synchronous boost converter topology operating in discontinuous conduction mode, at light loads, the TPS65165 maintains continuous conduction even at minimal load currents. This is achieved with a novel architecture using an external Schottky diode with an integrated MOSFET in parallel connected between SW pin and the SUP pin. The purpose of this MOSFET is to allow the current to go below ground, which is the case at light load conditions. For this purpose, a small integrated P-Channel MOSFET (Q2) with a typical $\mathrm{R}_{\mathrm{DSON}}$ of $10 \Omega$ is sufficient. When the inductor current is positive, the external Schottky diode with the lower forward voltage carries the current. This causes the converter to operate with a fixed frequency in continuous-conduction mode over the entire load-current range. This avoids ringing on the switch pin as seen with a typical non-synchronous boost converter, and allows a simpler compensation network.

Figure 16. Boost Converter Block TPS65165

## SOFTSTART BOOST CONVERTER

To minimize inrush current during start-up, an external capacitor connected to the softstart pin (SS) is used to slowly ramp up the internal current limit of the boost converter. The larger the capacitor, the slower the ramp-up of the current limit, and the longer the softstart time. A $22-\mathrm{nF}$ capacitor is usually sufficient for typical applications.

SLVS723A-DECEMBER 2006-REVISED MAY 2007

## APPLICATION INFORMATION (continued)

## HIGH VOLTAGE STRESS TEST BOOST CONVERTER AND POSITIVE CHARGE PUMP

The TPS65165 incorporates a high voltage stress test where the output voltage of the boost converter Vs and the positive charge pump POUT are set to a higher output voltage compared to the nominal programmed output voltage. The High Voltage Stress test is enabled by pulling the HVS pin to high. With HVS=high the voltage on POUT, respectively VGH is regulated to a fixed output voltage of 30 V . The boost converter Vs is programmed to a higher voltage determined by the resistor connected to RHVS. With HVS=high the RHVS pin is pulled to GND which sets the voltage for the boost converter during the High Voltage Stress Test. The output voltage for the boost converter during high voltage stress test is calculated as:

$$
\begin{align*}
& V_{S_{H V S}}=V_{F B} \frac{R 1+R 2 \| R 4}{R 2 \| R 4}=1.146 V \frac{R 1+R 2 \| R 4}{R 2 \| R 4} \\
& R 4=\frac{R 1 \times R 2}{\left(\frac{V_{s_{H V S}}}{V_{F B}}-1\right) \times R 2-R 1} \tag{2}
\end{align*}
$$

With:
$\mathrm{Vs}_{\mathrm{HVS}}=$ Boost converter output voltage with HVS=high
$V_{F B}=1.146 \mathrm{~V}$
R4 = Resistor connected to pin RHVS

## OVERVOLTAGE PROTECTION BOOST CONVERTER

The boost converter has an integrated overvoltage-protection circuit to prevent the switch voltage from exceeding the absolute maximum switch voltage rating in the event of a system fault. The device protects itself if the feedback pin is shorted to ground by clamping the boost-converter output voltage to 20 V . To implement the overvoltage protection, the overvoltage comparator shown in Figure 16 monitors the output voltage via the SUP pin. When the output voltage exceeds the overvoltage threshold of typically 20 V , the device stops switching until the output voltage drops below the comparator threshold again. The typical waveform is shown in Figure 6 .

## INPUT CAPACITOR SELECTION VIN, SUP

Low-ESR ceramic capacitors are recommended for good input-voltage filtering. The TPS65165 has an analog input (VIN) and a power supply input (SUP) powering all the internal rails, including the operational amplifiers. $1-\mu \mathrm{F}$ bypass capacitors are required as close as possible from VIN to GND, and from SUP to GND. Depending on the overall load current, two or three $22-\mu \mathrm{F}$ input capacitors are required. For better input-voltage filtering, the input capacitor values can be increased. Refer to Table 1 and typical applications for input capacitor recommendations.

Table 1. Input Capacitor Selection

| CAPACITOR | VOLTAGE RATING | COMPONENT <br> SUPPLIER | COMMENTS |
| :---: | :---: | :--- | :--- |
| $22 \mu \mathrm{~F} / 1210$ | 6.3 V | Taiyo Yuden | Cin |
| $1 \mu \mathrm{~F} / 1206$ | 6.3 V | Taiyo Yuden | Bypass AVIN, SUP |

## BOOST CONVERTER DESIGN PROCEDURE

The first step in the design procedure is to verify whether the maximum possible output current of the boost converter supports the specific application requirements. To simplify the calculation the fastest approach is to estimate the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst case assumption for the expected efficiency, e.g., $80 \%$. With the efficiency number it is possible to calculate the steady state values of the application.

1. Converter Duty Cycle:

$$
\begin{equation*}
D=1-\frac{\operatorname{Vin} \times \eta}{\text { Vout }} \tag{3}
\end{equation*}
$$

2. Maximum output current:

$$
\begin{equation*}
\text { lout }=\left(\operatorname{Isw}-\frac{\operatorname{Vin} \times D}{2 \times f s \times L}\right) \times(1-D) \tag{4}
\end{equation*}
$$

3. Peak switch current:

$$
\begin{equation*}
I_{\text {swpeak }}=\frac{\operatorname{Vin} \times D}{2 \times f s \times L}+\frac{I_{\text {out }}}{I-D} \tag{5}
\end{equation*}
$$

With:
Isw = converter switch current (minimum switch current limit=4.4 A)
fs = converter switching frequency (typical 600 kHz )
$L=$ Selected inductor value
$\eta$ = Estimated converter efficiency (use the number from the efficiency curves or 0.8 as an estimation)
The peak switch current is the steady state peak switch current the integrated switch, inductor and external Schottky diode has to be rated for. The calculation must be done for the minimum input voltage where the peak switch current is highest.

## INDUCTOR SELECTION

The TPS65165 typically operates with a $10-\mu \mathrm{H}$ inductor. The main parameter for inductor selection is the inductor saturation current. This should be higher than the peak switch current as calculated in Equation 5, with additional margin for heavy load transients. An alternative, more conservative approach is to choose the inductor with saturation current at least as high as the typical switch current limit of 5.5 A.
The second important parameter is the inductor DC resistance. Usually the lower the DC resistance the higher the efficiency of the converter. The choice of an inductor can affect converter efficiency by as much as $10 \%$. Possible inductors are shown in table 2

Table 2. Inductor Selection Boost Converter

| INDUCTOR VALUE | COMPONENT SUPPLIER | DIMENSIONS IN mm | Isat/DCR |
| :---: | :---: | :---: | :---: |
| $10 \mu \mathrm{H}$ | Sumida CDRH8D38-100 | $8.3 \times 8.3 \times 4.0$ | $3.0 \mathrm{~A} / 38 \mathrm{~m} \Omega$ |
| $10 \mu \mathrm{H}$ | Wuerth 744066100 | $10 \times 10 \times 3.8$ | $4.0 \mathrm{~A} / 25 \mathrm{~m} \Omega$ |
| $10 \mu \mathrm{H}$ | Coilcraft DO3316P-103 | $12.95 \times 9.4 \times 5.51$ | $3.8 \mathrm{~A} / 3838 \mathrm{~m} \Omega$ |

## OUTPUT CAPACITOR SELECTION

For best output voltage filtering, a low-ESR output capacitor is recommended. Ceramic capacitors have a low ESR value and work best with the TPS65165. Three $22 \mu \mathrm{~F}$ or six 10 uF ceramic output capacitors in parallel are sufficient for most applications. More capacitors can be added to improve the load transient regulation. Refer to Table 3 for details on selecting output capacitors.

Table 3. Output Capacitor Selection

| CAPACITOR | VOLTAGE RATING | COMPONENT SUPPLIER |
| :---: | :---: | :---: |
| $22 \mu \mathrm{~F} / 1812$ | 16 V | Taiyo Yuden EMK432BJ226MM |

## Rectifier diode selection

To achieve high efficiency, a Schottky diode should be used. The reverse voltage rating should be higher than the maximum output voltage of the converter. The current rating for the Schottky diode is calculated as the off time of the converter times the typical switch current of the TPS65165:

$$
\begin{equation*}
\mathrm{I}_{\mathrm{avg}}=(1-\mathrm{D}) \times \mathrm{Isw}=\frac{\mathrm{Vin}}{\text { Vout }} \times 5.5 \mathrm{~A} \tag{6}
\end{equation*}
$$

where Isw = the typical switch current of the TPS65165 (5.5 A)
A Schottky diode with 2-A maximum average rectified forward current rating is sufficient for most applications.
The Schottky rectifier must have adequate power dissipation. The dissipated power is the average rectified forward current times the diode forward voltage.

$$
\begin{equation*}
P_{D}=I_{\text {avg }} \times V_{F}=I s w \times(1-D) \times V_{s w} \times \frac{V \text { in }}{\text { Vout }} \times V_{F} \tag{7}
\end{equation*}
$$

where Isw = typical switch current of the TPS65165 (5.5 A)

## Table 4. Rectifier Diode Selection (Boost Converter)

| CURRENT RATING <br> $\mathbf{l}_{\text {avg }}$ | $\mathbf{V r}$ | $\mathbf{V}_{\text {forward }}$ | $\mathbf{R}_{\theta \mathrm{JA}}$ | SIZE | COMPONENT SUPPLIER |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 A | 20 V | 0.36 V at 3 A | $46^{\circ} \mathrm{C} / \mathrm{W}$ | SMC | MBRS320, International Rectifier |
| 2 A | 20 V | 0.44 V at 2 A | $75^{\circ} \mathrm{C} / \mathrm{W}$ | SMB | SL22, Vishay Semiconductor |
| 2 A | 20 V | 0.5 V at 2 A | $75^{\circ} \mathrm{C} / \mathrm{W}$ | SMB | SS22, Fairchild Semiconductor |

## SETTING THE OUTPUT VOLTAGE AND SELECTING THE FEEDFORWARD CAPACITOR

The output voltage is set by the external resistor-divider value, and is calculated as:

$$
\begin{equation*}
\mathrm{V}_{\text {out }}=1.146 \mathrm{~V} \times\left(1+\frac{\mathrm{R} 1}{\mathrm{R} 2}\right) \tag{8}
\end{equation*}
$$

Across the upper resistor, a bypass capacitor is required to speed up the circuit during load transients. The capacitor value is caluculated as:

$$
\begin{equation*}
\mathrm{C} f f=\frac{1}{2 \times \pi \times f \mathrm{z} \times \mathrm{R} 1}=\frac{1}{2 \times \pi \times 5000 \times \mathrm{R} 1} \tag{9}
\end{equation*}
$$

A standard value nearest to the calculated value should be used.

## COMPENSATION (COMP)

The regulator loop can be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier. A single capacitor connected to this pin sets the low-frequency gain. A $1.0-\mathrm{nF}$ capacitor is sufficient for most of the applications. Adding a series resistor sets an additional zero and increases the high-frequency gain. Equation 10 calculates the frequency where the resistor increases the high frequency gain.

$$
\begin{equation*}
f_{\mathrm{Z}}=\frac{1}{2 \times \pi \times \mathrm{Cc} \times \mathrm{Rc}} \tag{10}
\end{equation*}
$$

Lower input voltages require a higher gain, and therefore a lower compensation-capacitor value. Refer to the typical applications for the appropriate component selection.

## POSITIVE CHARGE PUMP

The fully-integrated positive charge pump automatically switches its gain between doubler and tripler mode. As shown in Figure 17, the input voltage of the positive charge pump is the SUP pin, that is connected to the output of the main boost converter (Vs).
The charge pump requires two $330-\mathrm{nF}$ flying capacitors and a $1-\mu \mathrm{F}$ output capacitance for stable operation. The positive charge pump also supports the high-voltage stress test by pulling the HVS pin high. This programs the output voltage to a fixed output voltage of 30 V by using the internal voltage divider as shown in Figure 17. During normal operation the HVS pin is pulled low, and the output voltage is programmed with the external voltage divider.

$$
\begin{align*}
\mathrm{V}_{\text {out }} & =1.213 \mathrm{~V} \times\left(1+\frac{\mathrm{R} 5}{\mathrm{R} 6}\right) \\
\mathrm{R} 5 & =\mathrm{R} 6 \times\left(\frac{\mathrm{V}_{\text {out }}}{\mathrm{V}_{\mathrm{FB}}}-1\right)=\mathrm{R} 6 \times\left(\frac{\mathrm{V}_{\text {out }}}{1.213}-1\right) \tag{11}
\end{align*}
$$

To minimize noise and leakage-current sensitivity, we recommend a value of approximately $20 \mathrm{k} \Omega$ for the lower feedback divider resistor R6. A 100-pF feedforward capacitor across the upper feedback resistor R5 is typically required.

Figure 17. Positive Charge Pump Block TPS65165

SLVS723A-DECEMBER 2006-REVISED MAY 2007

## NEGATIVE CHARGE PUMP DRIVER

The negative charge pump provides a regulated output voltage set by the external resistor divider. It inverts the voltage applied to the SUP pin (the boost-converter output voltage), and regulates it to the programmed voltage.

Figure 18. Negative Charge Pump Block TPS65165
The output voltage is $\mathrm{VGL}=(-\mathrm{Vs})+\mathrm{V}_{\text {DROP }}$. $\mathrm{V}_{\mathrm{DROP}}$ is the voltage drop across the external diodes and internal charge pump MOSFETs.
Setting the output voltage:

$$
\begin{align*}
& V_{\text {out }}=-V_{\text {REF }} \times \frac{R 7}{R 8}=-1.213 \mathrm{~V} \times \frac{\mathrm{R} 7}{\mathrm{R8}}  \tag{12}\\
& R 7=R 8 \times \frac{\left|V_{\text {out }}\right|}{V_{\text {REF }}}=R 8 \times \frac{\mid V_{\text {out }}}{1.213} \tag{13}
\end{align*}
$$

Since the reference-output driver current should typically not exceed $30 \mu \mathrm{~A}$, the lower feedback-resistor value R8 should be in a range of $40 \mathrm{k} \Omega$ to $120 \mathrm{k} \Omega$. The negative charge pump requires two external Schottky diodes. The peak current rating of the Schottky diode must be twice the load current of the output. For a 20 -mA output current, the dual Schottky diode BAT54 is a good choice.

## HIGH VOLTAGE SWITCH CONTROL (Gate Voltage Shaping)

For correct operation of this block it is not recommended to connect an output capacitor to VGH. If the output shows higher output ripple voltage than expected then the output capacitor value on POUT needs to be increased instead. The device has an integrated high-voltage switch to provide gate-voltage modulation of VGH. If this feature is not required, then CTRL pin must be pulled high or connected to VIN. When the device is disabled or the input voltage is below the undervoltage lockout (UVLO), both switches (Q4 and Q5) are off, and VGH is discharge by a $1-\mathrm{k} \Omega$ resistor over Q8, as shown in Figure 19.

Figure 19. High Voltage Switch (Gate Voltage Shaping) Block TPS65165
To implement gate-voltage shaping, the control signal from the LCD timing controller (TCON) is connected to the CTRL pin. CTRL is activated when the device is enabled, the input voltage is above the undervoltage lockout, all the output voltages (Vs, VGL, VGH) are in regulation, and the delay time is set by the GDLY pin passed by. As soon as one of the outputs is pulled below its Power Good level, Q4 and Q5 are turned off and VGH is discharged via a $1-\mathrm{k} \Omega$ resistor over Q8.

With CTRL = high, Q4 is turned on and the charge pump output voltage is present at VGH. When the CTRL pin is pulled low, Q4 is turned off and Q5 is turned on, discharging VGH. The slope and time for discharging VGH is determined by the LCD capacitance and the termination on DRN. An additional output capacitor is not recommended on VGH. There are basically two options available to terminate the DRN pin, depending on the LCD capacitance and required overall converter efficiency.

Figure 20. High Voltage Switch (Gate Voltage Shaping) Timing Diagram
Option 1 in Figure 19 draws no current from Vs, and is therefore better in terms of converter efficiency. The voltage level VL (the discharge level of VGH) is determined by the LCD capacitance, the resistor connected to DRN and the off time, $\mathrm{t}_{\text {off. }}$. The lower the resistor value connected to DRN, the lower the discharge voltage level VL.
Option 2 in Figure 19 constantly draws current from Vs due to the voltage divider connected to Vs. The advantage of this solution is that the low-level voltage VL is given by the voltage divider, assuming the feedback resistor values are small, allowing the LCD capacitance to discharge during $\mathrm{t}_{\mathrm{off}}$. This solution is not recommended for very large display panels because the feedback divider resistor values must be too low, drawing too much current from Vs.

## Operational Amplifier 1, 2 and 3

The TPS65165 has three integrated operational amplifiers. OpAmp 3 is already configured as a standard buffer as shown in Figure 21. The operational amplifiers can be used as a gamma correction buffer or as a VCOM buffer.

Figure 21. Operational Amplifier Block
The OpAmp power supply pin is the SUP pin connected to the boost converter Vs. To achieve good performance and minimize the output noise, a $1-\mu \mathrm{F}$ bypass capacitor is required directly from the SUP pin to ground. When the device is disabled, the OpAmp outputs are pulled low via a $10 \mathrm{k} \Omega$ resistor. The OpAmps are not designed to drive capacitive loads; therefore it is not recommended to connect a capacitor directly to the OpAmp outputs. If capacitive loads are driven we recommend using a series resistor at the output to provide stable operation. With a $3.3-\Omega$ series resistor, a capacitive load of 10 nF can be driven, which is usually sufficient for typical LCD applications.

## Operational Amplifier Termination

The TPS65165 has three integrated operational amplifiers. For some applications, not all of the amplifiers are used. To minimize device quiescent current the terminals need to be terminated. For the unity gain buffer, OpAmp 3 the positive terminal is connected to GND and the output is left open. For OpAmp 2 and 3 the negative terminal is connected to the OpAmp output and the positive terminal is connected to GND. Using such a termination minimizes device quiescent current and correct functionality of the device.

PCB Layout Design Guidelines:

1. Place the power components outlined in bold first on the PCB.
2. Rout the traces outlined in bold with wide PCB traces
3. Place a $1-\mu \mathrm{F}$ bypass capacitor directly from the Vin pin to GND since this is the supply pin for internal circuits.
4. Place a $1-\mu \mathrm{F}$ bypass capacitor directly from the SUP pin to GND since this is the supply pin for internal circuits.
5. Use a short and wide trace to connect the SUP pin to the output of the boost converter Vs.
6. Place the $220-\mathrm{nF}$ reference capacitor directly from REF to AGND close to the IC pins.
7. The feedback resistor for the negative charge pump between FBN and REF needs to be $>40 \mathrm{k} \Omega$.
8. Use short traces for the charge pump drive pin (DRVN) of VGL because the traces carry switching waveforms.
9. Place the flying capacitors as close as possible to the C1P, C1N and C2P, C2N pin.
10. Solder the Power Pad of the QFN package to GND and use thermal vias to lower the thermal resistance

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead finish/ Ball material <br> (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TPS65165RSBR | ACTIVE | WQFN | RSB | 40 | 3000 | RoHS \& Green | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | $\begin{aligned} & \hline \text { TPS } \\ & 65165 \end{aligned}$ | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free"
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: Tl defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000$ ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

SOLDER MASK DETAILS

NOTES: (continued)
4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271)
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE BASED ON 0.125 MM THICK STENCIL SCALE: 20X

NOTES: (continued)
6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http: //www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.
