

4W AUDIO AMPLIFIER

- HIGH OUTPUT CURRENT CAPABILITY
- PROTECTION AGAINST CHIP OVERTEMPERATURE
- LOW NOISE
- HIGH SUPPLY VOLTAGE REJECTION
- SUPPLY VOLTAGE RANGE: 4V TO 20V

DESCRIPTION

The TDA 1904 is a monolithic integrated circuit in POWERDIP package intended for use as low-frequency power amplifier in wide range of applications in portable radio and TV sets.

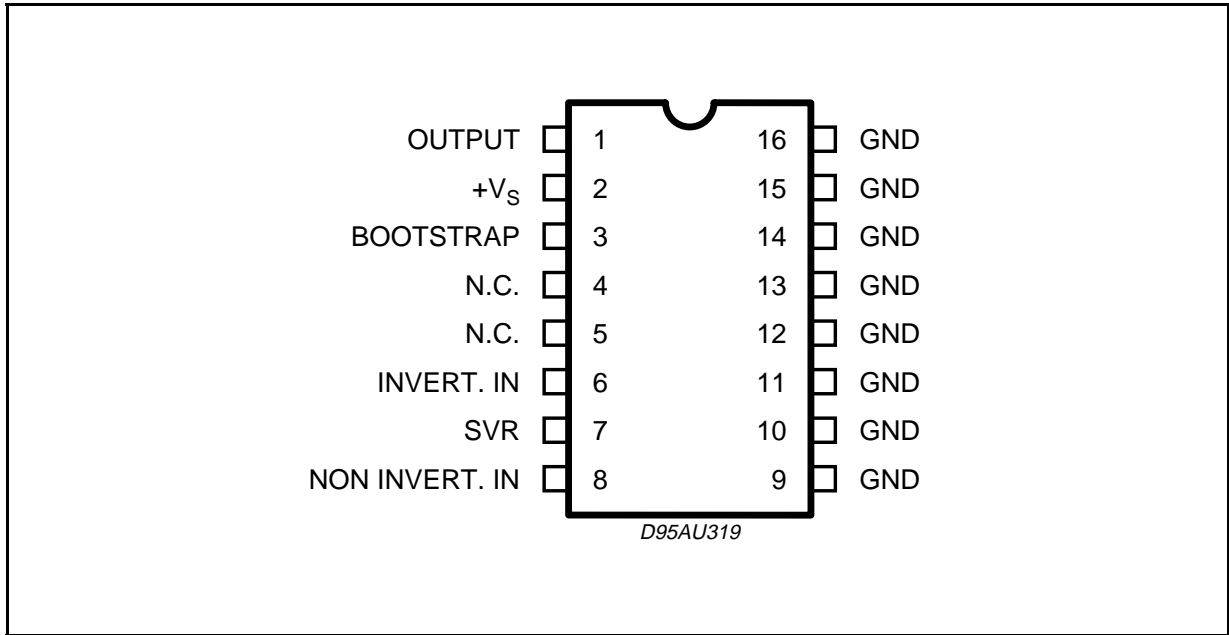

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_s	Supply voltage	20	V
I_o	Peak output current (non repetitive)	2.5	A
I_o	Peak output current (repetitive)	2	A
P_{tot}	Total power dissipation at $T_{amb} = 80^\circ\text{C}$	1	W
	at $T_{pins} = 60^\circ\text{C}$	6	W
T_{stg}, T_j	Storage and junction temperature	-40 to 150	$^\circ\text{C}$

APPLICATION SUGGESTION

The recommended values of the external components are those shown on the application circuit of fig. 1.

When the supply voltage V_S is less than 6V, a 68 Ω resistor must be connected between pin 2 and pin

3 in order to obtain the maximum output power.

Different values can be used. The following table can help the designer.

Components	Recomm. value	Purpose	Larger than recommended value	Smaller than recommended value	Allowed range	
					Min.	Max.
R1	10 K Ω	Feedback resistors	Increase of gain.	Decrease of gain. Increase quiescent current.	9R3	
R2	100 Ω		Decrease of gain.	Increase of gain.		1 K Ω
R3	4.7 Ω	Frequency stability	Danger of oscillation at high frequencies with inductive loads.			
R4	68 Ω	Increase of the output swing with low supply voltage.			39 Ω	220 Ω
C1	2.2 μ F	Input DC decoupling.	Higher cost lower noise.	Higher low frequency cutoff. Higher noise.		
C2	0.1 μ F	Supply voltage bypass.		Danger of oscillations.		
C3	22 μ F	Ripple rejection	Increase of SVR increase of the switch-on time.	Degradation of SVR.	2.2 μ F	100 μ F
C4	2.2 μ F	Inverting input DC decoupling.	Increase of the switch-on noise	Higher low frequency cutoff.	0.1 μ F	
C5	47 μ F	Bootstrap.		Increase of the distortion at low frequency.	10 μ F	100 μ F
C6	0.22 μ F	Frequency stability.		Danger of oscillation.		
C7	1000 μ F	Output DC decoupling		Higher low frequency cutoff.

THERMAL SHUT-DOWN

The presence of a thermal limiting circuit offers the following advantages:

- 1) An overload on the output (even if it is permanent), or an above limit ambient temperature can be easily tolerated since the T_j cannot be higher than 150°C.
- 2) The heatsink can have a smaller factor of safety compared with that of a conventional circuit. There is no possibility of device damage due to high junction temperature. If for any reason, the junction temperature increase up to 150°C, the thermal shut-down simply reduces the power dissipation and the current consumption.

MOUNTING INSTRUCTION

The TDA 1904 is assembled in the Powerdip, in which 8 pins (from 9 to 16) are attached to the frame and remove the heat produced by the chip.

Figure 21 shows a PC board copper area used as a heatsink ($l = 65 \text{ mm}$).

The thermal resistance junction-ambient is 35°C.
